

NOTUS UK SUPPLIES TRAWL MONITORING TO IRELAND

Notus UK Ltd will now supply and service the Trawlmaster trawl monitoring system to Ireland. This system has been installed on 100+ twin riggers in Scotland, England and Northern Ireland. Notus UK's area was expanded due to growing inquiries from Irish skippers.

The Notus Trawlmaster has been the #1 trawl monitoring solution for twin riggers in the UK for some time. A typical twin rig setup will monitor the spread on EACH net, measure the trawl wires and calculate the middle wire adjustment. This system has been specifically designed to monitor exactly what a twin rigger needs to see.

The manager of Notus UK, James Masson, services and installs systems in Ireland. James is an ex twin rig skipper with 20 years experience fishing. That enables Notus to offer a unique service to its Irish customers. After the initial installation, James attends an at sea commissioning. The system is setup correctly and James offers suggestions for fine tuning the trawl gear. Upon leaving the vessel, the Trawlmaster and the twin rig gear are fine tuned for optimal fishing.

This service has been the main reason for Notus UK's success.

Notus UK recently installed a system on Zeik Tuit's MFV Corona Gloria. Before purchasing the system, Zeik spoke to many skippers using Notus. Zeik offered the following comment on the system "After installing Notus we seen we had to take back the clump another 8 ft to keep it in line. We also learned we sometimes shot too much wire and overspread the gear. We have improved fishing with the system."

As part of the Notus package, the Corona Gloria has a long range hydrophone, fast charger and long life batteries. The fast charger can recharge 4 sensors in less than two hours. The long life batteries offer double the battery capacity of the previous versions.

This means there are now two companies that supply and service Notus in Ireland, Sonartron (Killybegs) and Notus UK.
